**PEDIATRIC IMPETIGO**

**DEFINITION**
A highly contagious, superficial bacterial infection of the skin, it primarily affects children during the summer. Beginning with vesicles, it progresses to honey crusted lesions and is commonly seen on the face, arms, legs and buttocks.

Nurses with Remote Practice Certified Practice designation (RN(C)s) are able to treat children with impetigo who are 6 months of age and older.

**POTENTIAL CAUSES**
- *S. aureus* is the principal pathogen.
- *Group A Beta-hemolytic strep* presents alone or in conjunction with *S aureus* in a minority of cases.

**PREDISPOISING RISK FACTORS**
- Local skin trauma such as insect bites, wounds
- Skin lesions from other disorders such as eczema, scabies, pediculosis
- Age – more common in pre-school and young children (2-5 years)
- Crowded living conditions
- Poor hygiene
- Warm, moist climate

**TYPICAL FINDINGS OF IMPETIGO**

**History**
- More common on face, scalp and hands, but may occur anywhere
- Involved area is usually exposed
- Usually occurs during summer

---

1 RN(C) is an authorized title recommended by CRNBC that refers to CRNBC-certified RNs, and is used throughout this Decision Support Tool (DST).
- New lesions usually due to auto-inoculation
- Rash begins as tiny red lesions, which may be itchy
- Lesions rapidly become small vesicles, progressing to pustules, which rupture and drain to form yellow crusts
- Lesions painless
- Fever and systemic symptoms rare - mild fever may be present in more generalized infections
- Known MRSA positive (client or household member)

**Physical Assessment**
- Weigh until 12 years of age for medication calculations
- Thick, golden yellow, crusted lesion on a red base
- Numerous skin lesions at various stages present (vesicles, pustules, crusts, serous or pustular drainage, healing lesions)
- In infants and young children, the bullous form of impetigo may occur. In this case the vesicles continue to enlarge and form flaccid bullae (blisters) with a clear yellow fluid that slowly darkens. When these rupture they leave a thin brown to golden yellow coloured crusts.
- Lesions and surrounding skin may feel warm to touch
- Regional lymph nodes may be enlarged and/or tender

**Diagnostic Tests**
- Culture and Sensitivity of lesions if widespread or not responding to treatment.
- Determine blood glucose level if infection is recurrent or if symptoms suggestive of diabetes mellitus are present.

**MANAGEMENT AND INTERVENTIONS**

**Goals of Treatment**
- Resolve infection
- Prevent auto-inoculation
- Prevent spread to other household members

**Non-pharmacologic Interventions**
- Apply warm saline compresses to soften and soak away crusts qid for 15 minutes and prn

**Pharmacologic Interventions**

*All drugs must be calculated by weight until age 12.*

*Do not use more than an adult dose.*

Apply topical antibiotic preparation after each soaking:
- Mupirocin ointment to affected lesions tid for 7 days

If non-responsive:
- Fusidic acid ointment or cream tid or qid for 7 days

Topical agents are sufficient when there are only a small number of non-bullous lesions.

Oral antibiotics may be necessary if there are multiple lesions making topical treatment impractical, the client is febrile and has systemic symptoms including lymphadenopathy, or if bullous impetigo is present:
- Cephalexin 30-40mg/kg po per day divided qid for 7 days, maximum 2 grams daily
  OR
- Cloxacillin 40-50mg/kg po per day divided qid for 7 days (tastes unpleasant so use cephalexin first)

For clients with allergy to penicillin:
- Erythromycin 40mg/kg po per day divided qid for 7 days

**If known MRSA positive or MRSA positive swab:**
- Trimethoprim / sulfamethoxazole 8-12 mg / kg per day po bid for 7 days (dosing is based on trimethoprim.)

Pregnant or Breastfeeding Women (dosing as above)
- Mupirocin, cephalexin, cloxacillin and erythromycin may be used.
- Avoid fusidic acid ointment.
- DO NOT USE trimethoprim /sulfamethoxazole.

**POTENTIAL COMPLICATIONS**
- Localised or widespread cellulitis
- Post-streptococcal glomerulonephritis (rare)
- Sepsis

**CLIENT/CAREGIVER EDUCATION AND DISCHARGE INFORMATION**
- Advise on condition, timeline of treatment and expected course of disease process.
- Counsel parent or caregiver about appropriate use of medications (dose, frequency, compliance).
- Remain home from school/day care for 24 hours after treatment started.
- Recommend proper hygiene (i.e., daily washing).
- Cut fingernails to prevent scratching.
- Counsel client about prevention of future episodes
- Submit strategies to prevent spread to other household members (i.e., proper hand-washing of all household members, use of separate towels).

**MONITORING AND FOLLOW-UP**
- Follow-up in 2-3 days to assess response to treatment.
- Instruct client to return for reassessment if fever develops or infection spreads despite therapy.

**CONSULTATION AND/OR REFERRAL**
- Consult a physician or nurse practitioner if no response to treatment.

**DOCUMENTATION**
- As per agency policy
